PROFESSIONAL SUMMARY

Senior QA Automation Lead with 13+ years building end-to-end quality for enterprise clients across government, banking, fintech, healthtech, manufacturing and e-commerce, and **strategic integrator** of the **QASL Shift-Left Testing Framework**, a published operating framework that systematizes Shift-Left Testing under ISTQB v4 and ISO/IEC/IEEE 29119 / 29148. My specialty is **defect prevention**: detecting and eliminating defects at the requirements stage, before the first line of code — with AI-assisted static analysis of User Stories that raises test coverage from ~30% to **100% before development** and produces full traceability (Epic → User Story → Suite → Precondition → Test Case) ready for the first deployment.

In execution: I design **Playwright + TypeScript** frameworks (Page Object Model, Service Object Pattern), integrate automation across the full **Azure DevOps** cycle (Boards, Test Plans, Repos, YAML Pipelines) and lead teams of up to **10 QA Engineers**. I cover Performance (K6, JMeter — stress 1,000+ VUs), Security (OWASP ZAP) and **AI/LLM/Voice AI Testing** (red-teaming with Garak, multi-model LLM-as-Judge, ElevenLabs). Creator of the open-source QASL tooling ecosystem.

"QA success is measured not only by the bugs it finds, but by the ones it prevents from ever existing."

CORE SKILLS

Shift-Left & Defect Prevention (differentiator)

AI-assisted static requirements analysis (Claude API), coverage-gap detection, Gherkin scenario generation and full traceability in PostgreSQL before development · VCR framework (Value+Cost+Risk) to decide automation

CI/CD & Azure DevOps

Azure Boards, Test Plans, Repos, YAML Pipelines, JUnit Publishing, GitLab CI / Docker Runner, GitHub Actions, Docker Compose, Grafana, Prometheus, InfluxDB

Mobile · Web3 · Observability

Maestro, Android, mitmproxy, HAR capture and CI Quality Gates · MetaMask + Dappwright, JSON-RPC, ghost-error detection · Grafana, Prometheus, InfluxDB, Health Score, integration graph

Backend & Data for QA

Node.js + Express (own APIs in production), Python, PostgreSQL 16, SQL Server, Azure SQL, SQL Validation Layer, Docker/Docker Compose, MCP Protocol

Test Automation E2E & API

Playwright + TypeScript, Page Object Model, Service Object Pattern (APIRequestContext), Fixtures, Parallel Execution, Flaky Test Reduction, Newman + Postman, Allure

Performance · Security · AI/LLM

K6, JMeter, Gatling · Stress (1,000+ VUs) / Soak (1–4h) · OWASP ZAP, MobSF · Garak (NVIDIA NeMo), LLM-as-Judge, ElevenLabs, Claude API, GPT-4, Gemini, Prompt Injection, OWASP LLM Top 10:2025

Leadership & Standards

Up to 10 QA Engineers, 8+ parallel projects, OKRs/SMART, mentoring 15+ juniors, JIRA + Xray, Scrum · ISTQB v4.0, ISO/IEC/IEEE 29119-3:2021, ISO/IEC/IEEE 29148:2018

PROFESSIONAL EXPERIENCE

Senior QA Automation Engineer

Apr 2026 – Jul 2026

IT Consulting Firm · Contract · International Enterprise Project (under NDA) · Manufacturing & Production sector

Remote

- Automated **E2E testing with Playwright + TypeScript** integrated across the full **Azure DevOps** cycle, with User Story → Test Case → Bug traceability.
- Designed a **three-layer** testing architecture — E2E, API Contract and Data Validation over SQL Server — to guarantee integrity between frontend and backend.
- Implemented end-to-end **YAML Pipelines** in Azure Pipelines with headless execution and automatic publishing of JUnit results.

QA Tech Lead

Mar 2025 – Apr 2026

EPIDATA Consulting · Government & enterprise sector

Hybrid · Buenos Aires

- Led 10 QA Engineers** (manual + automated) across 8+ simultaneous enterprise projects — greenfield and re-engineering. Defined OKRs/SMART, provided technical mentoring and controlled deliverable quality.
- Implemented Shift-Left Testing** in enterprise projects, applying E2E automation, API integration testing, security with **OWASP ZAP** and performance testing with **K6** from early cycle stages.
- Shift-Left with AI:** static analysis of User Stories with Claude API for early gap detection and generation of **1,300+ test cases before development started**, with full traceability US → Suite → Test Case — a practice I systematized and evolved into my open-source engine **NEXUS Requirements** (requirements certification against an ISTQB/ISO rule catalog).
- Voice AI Stress Testing (enterprise project under NDA):** load testing on an ElevenLabs conversational endpoint validating the voice→text→LLM→text→voice flow. Python wrapper + ElevenLabs SDK (HTTPS), monitored with JMeter — saturation (429/500), latency and conversational quality.
- AI/LLM Testing:** framework with Garak (NVIDIA NeMo) for red-teaming and multi-model LLM-as-Judge (Claude/GPT-4/Gemini); 100% OWASP LLM Top 10:2025 coverage.
- Dual-VM QA infrastructure (29 tools)** approved by the client's Management, Servers and SOC: automation VM (Playwright, Newman, GitLab Runner) + performance/security VM (K6, JMeter, OWASP ZAP, Garak, MobSF) with a Grafana/Prometheus/InfluxDB stack in Docker.
- Real-time QA observability:** executive dashboard with integrated AI, live environment monitor, installable mobile PWA with execution trigger from a phone and a dynamic executive PDF — in production with real data.
- Performance & CI/CD:** Stress (200–1,000+ VUs) and Soak (1–4h) to detect race conditions and memory leaks; GitLab Runner Docker pipeline (INFO → E2E → API → NOTIFY → DEPLOY) with reports on GitLab Pages.

QA Automation Engineer

Aug 2020 – Dec 2024

UPEX · E-commerce · Fintech · Banking · Healthtech

Remote

- Designed **Page Object Model frameworks in Playwright + TypeScript** with E2E coverage across **4 simultaneous production products**; automated BDD with Cucumber/Gherkin in fintech and led the migration to Playwright while preserving Given-When-Then scenarios.
- Implemented **Service Object Pattern (APIRequestContext)** for REST API automation (Swagger/OpenAPI) with SQL Validation and Evidence Layer (screenshots, requests, responses, logs), and US↔TC traceability in Azure DevOps.
- Ran performance with **JMeter and K6** on critical payment flows (PCI-DSS, ISO 8583) and **security testing with OWASP ZAP** in regulated sectors (fintech/healthtech).
- Integrated **CI/CD pipelines in Azure Pipelines (YAML) and GitHub Actions** in headless mode with automatic JUnit publishing; technical mentoring for **15+ junior professionals**.

QA Lead / Project Manager

Apr 2013 – May 2020

STOP MEDICAL · Healthcare sector · HIS / HIPAA

On-site · Caracas

- Led the implementation of **Hospital Information Systems (HIS)** under **HIPAA compliance across 5 medical centers**; validated sensitive clinical data migrations and coordinated multidisciplinary teams of up to **8 professionals**.

PUBLISHED METHODOLOGY & OPEN SOURCE PROJECTS

QASL Shift-Left Testing Framework PUBLISHED FRAMEWORK · CC BY-NC-ND

Operating framework that unifies **ISTQB v4.0, ISO/IEC/IEEE 29119, ISO/IEC/IEEE 29148:2018, OWASP LLM Top 10:2025 and NIST AI RMF** into an executable QA strategy: 17 operational documents (ISTQB-format User Story template, Master Test Plan, IEEE 1028 review checklist, 29119-3 reports), strategic guides (VCR, risk, performance, DevSecOps, AI/LLM testing, data quality) and the **VCR framework (Value + Cost + Risk)** for objective automation prioritization. e-gregorio.github.io/qa-shiftleft-methodology · github.com/E-Gregorio/qa-shiftleft-methodology

01 · NEXUS Requirements — AI Requirements Certification Engine FLAGSHIP · PUBLIC · VERIFIED · REAL RUN IN THE REPO
Engine that certifies User Stories **before the first line of code**: a 4-agent pipeline (Claude API) orchestrated with JSON Schema contracts that normalizes any document into a canonical ISTQB User Story, evaluates it against an **executable rule catalog of 29 rules** (ISTQB v4 · ISO/IEC/IEEE 29148 · IEEE 1028 · OWASP), issues an **auditable verdict with RHI** (Requirement Health Index), detects coverage gaps per business rule and generates suites, preconditions and test cases with boundary data and **deterministic, idempotent IDs**. Real published result: ambiguous US → RHI 23.7 (NOT FIT) → 13 gaps with OWASP → 13 TCs → **0%→100% pre-development coverage**, Epic→US→BR→TC traceability verified with 22/22 integrity checks. Includes DoD→DoR Certificate with business approval, golden set and offline evals (QA of the engine with its own methodology). *Live demo: e-gregorio.github.io/nexus-requirements · github.com/E-Gregorio/nexus-requirements*

02 · QASL Framework — Enterprise Testing Platform ENTERPRISE · NDA
Static, E2E, API, performance, security and integration testing gain power when they live in a single pipeline. **Unifies all 7 layers into one Azure DevOps pipeline** that produces an **executive quality index**. Implemented in a real enterprise environment: evidence of automation architecture at scale and technical CI/CD leadership. *Stack: Azure DevOps · Playwright · Newman · k6 · OWASP ZAP · Grafana — e-gregorio.github.io/mi-portafolio/qasl-framework.html*

03 · Backend Live Server — Integration Intelligence PRODUCTION-PROVEN
Integration failures between systems become visible by observing real traffic. Analyzes real **HTTP (HAR)**, reconstructs the **integration graph through value propagation** and computes a **health score**. In production it located a queueing bottleneck against an external service: evidence of live diagnosis of complex systems. Real run: **869 requests · 191 systems · 357 integrations**. *Stack: Playwright · HAR · Node · Grafana · Health Score — github.com/E-Gregorio/QASL-BACKEND-LIVE-SCANNER*

04 · QASL Mobile — Mobile Integration Testing OPEN SOURCE
Mobile UI and its network layer reveal their real quality when tested together. Drives the real app with **Maestro**, captures API traffic (request/response with body) through a **proxy**, evaluates **pass/fail quality gates for CI** and streams the device live. Validates interface and network integration in a single run: evidence of end-to-end mobile testing. *Stack: Maestro · Android · mitmproxy · HAR · Quality Gates — github.com/E-Gregorio/qasl-mobile*

05 · QASL Web3 Sentinel — Blockchain Observability PUBLIC · MIT · 2026
In Web3 the truth of the system lives in the **JSON-RPC** layer, beneath the HTTP 200. Automates a real MetaMask wallet (Playwright + Dappwright), captures the session (HAR) and analyzes that layer to detect **ghost errors** — failures that travel inside an HTTP 200 and that classic tools mark green. HTML report, Grafana dashboard (28 panels) and CI quality gate. Calibrated against Uniswap production traffic (9 networks detected): evidence of testing in emerging domains and deep protocol observability. *Stack: MetaMask · Dappwright · JSON-RPC · Grafana (28 panels) — github.com/E-Gregorio/qasl-web3-sentinel*

06 · INGRID — AI Testing Platform AI SECURITY · AFQI
Testing language models demands an auditable, repeatable method. Applies **red-teaming**, **OWASP LLM Top 10:2025** coverage and **multi-model LLM-as-Judge**, and produces a **forensic verdict with score**. Implements the **AFQI (AI Forensic Quality Index)**: automated LLM evaluation over Claude API with 10/10 OWASP LLM Top 10:2025 coverage and a forensic PDF report. Evidence of specialization in AI/LLM testing and security, the fastest-growing area in QA. *Stack: Garak · OWASP LLM · LLM-as-Judge · Prompt Injection · Claude / GPT-4 — github.com/E-Gregorio/qasl-afqi*

voice-ai-testkit IN PROGRESS · 2026
Open-source Python framework for stress testing and automated evaluation of Voice AI agents (ElevenLabs, OpenAI Realtime, Whisper).

EDUCATION & CERTIFICATIONS

- Claude Code in Action — Anthropic Academy (2025) · 87.5%
- API Testing & Automation — UPEX Academy (2024)
- Playwright Advanced Testing — UPEX Academy (2023)
- ISTQB Foundation Level v4.0 — in preparation (exam 2026)
- Bachelor's Degree in Communications & Electronics — ESCOELFA, Caracas
